

ONE CLASS, ACROSS A REFACTOR

A word learns its *boundaries*.

1 class → 5 owners → 2 copies → 1 package

WorkspaceDaemon sheds four jobs, becomes **DaemonProcessCoordinator**, then moves out of the CLI. The split comes before the rename. The package copy comes before the cutover.

[Read all ten changes and rationale states ↓](#)

#149 · PHYSICAL CONSOLIDATION

The CLI copy is gone. All five class names are inside @symnav/daemon.

The package owns the word.

Aa CLI Aa package

Color + letterform = physical owner.
Green / linear → brick / casual

a ⌢ b

Typographic joins = direct imports.
Schematic; no call frequency or strength.

ab → a b

Spacing opens at a class boundary.
A repeated word is a physical copy.

why why?

Solid / dotted = stated / unexplained.
No underline = source observation.

method **method**

Member weight: private / public.
Class visibility ≠ package export.

What changed in the word.

Everything this specimen teaches is named here. Select a word to follow the mechanism into pinned source. The study covers this class's ownership, composition and visibility.

01 Activity

Activity moves from a private method to a static projector. Stated: explicit snapshots make it a pure projection.

Reason stated

02 Worker

Worker startup, replacement, release and shutdown collect in one manager. Stated: they share a lifecycle; recovery policy stays outside.

Reason stated

03 Delivery

Delivery and operation traces collect in one session. Stated: they share a coordination boundary; ledger and spool data keep their owners.

Reason stated

04 Execution

Accepted turns collect in one session. Stated: coordinate existing queue, ledger, worker and delivery owners through injected ports.

Reason stated

05 Composition

Across #144–#147, 44 members leave and 7 arrive: 81 → 44. Constructor: 68 → 132 lines. The four extracted names stay imported. These are source counts, not a complexity measure.

Source observation

Process

At #148, WorkspaceDaemon becomes DaemonProcessCoordinator. The plan requests a process coordinator; no specific reason for this class spelling was found.

Reason unexplained

Copy

At #148, the shell and four extracted classes have CLI and package copies; import paths change. The shipped CLI still uses its frozen copy; the class’s unit suites move to the package. Stated: review relocation separately from the consumer switch.

Reason stated

One

At #149 the 670-line CLI copy is deleted. The package process entry constructs the surviving coordinator. Stated: CLI owns invocation; daemon execution belongs behind DaemonClient.

Reason stated

Public

The shell exposes constructor and start() in all 27 PR-boundary snapshots. At #149 none of these five classes is exported by any package entry. The package offers four entry paths.

Source observation

Tests

Class-suite census: 65 → 82 named test declarations; none removed after normalizing the class rename. One #145 assertion is rewritten and adds two fileCount checks. Rationale for that exact test selection is unexplained.

Reason unexplained

Scope. This is one box’s history within main → #149, not a review of all 26 PRs. Constructor options, admission behavior, transport, cache lifetimes and other owners’ internals are outside this specimen. Selected method samples are real names; the domain words are abbreviations.

Evidence. 27 PR-boundary snapshots checked; 8 shown. Sources are frozen locally. Test counts are declarations in the class’s own suites, not a test-run result. Rationale search: supplied PR bodies and commits plus the architecture plan. No reader responses are collected.
